CDP Shield

TianyuGao

About Me

I am a solo developer with over 10 years of experience in Big Data, 5 years at HSBC, and 1 year focused on learning DeFi and Web3 technology to create innovative solutions.

Liquidation Risk

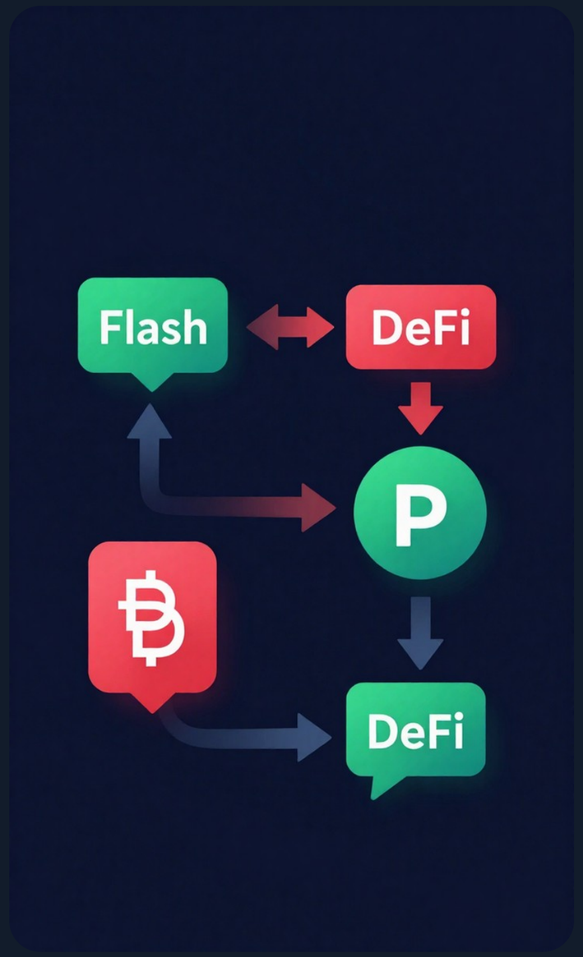

Why position monitoring matters

When collateral value falls or debt grows, a borrowing position can become eligible for liquidation. Monitoring position health helps users identify risk and consider repayment or additional collateral before liquidation.

Our Innovative Solutions for DeFi Liquidation

Real-time Monitoring

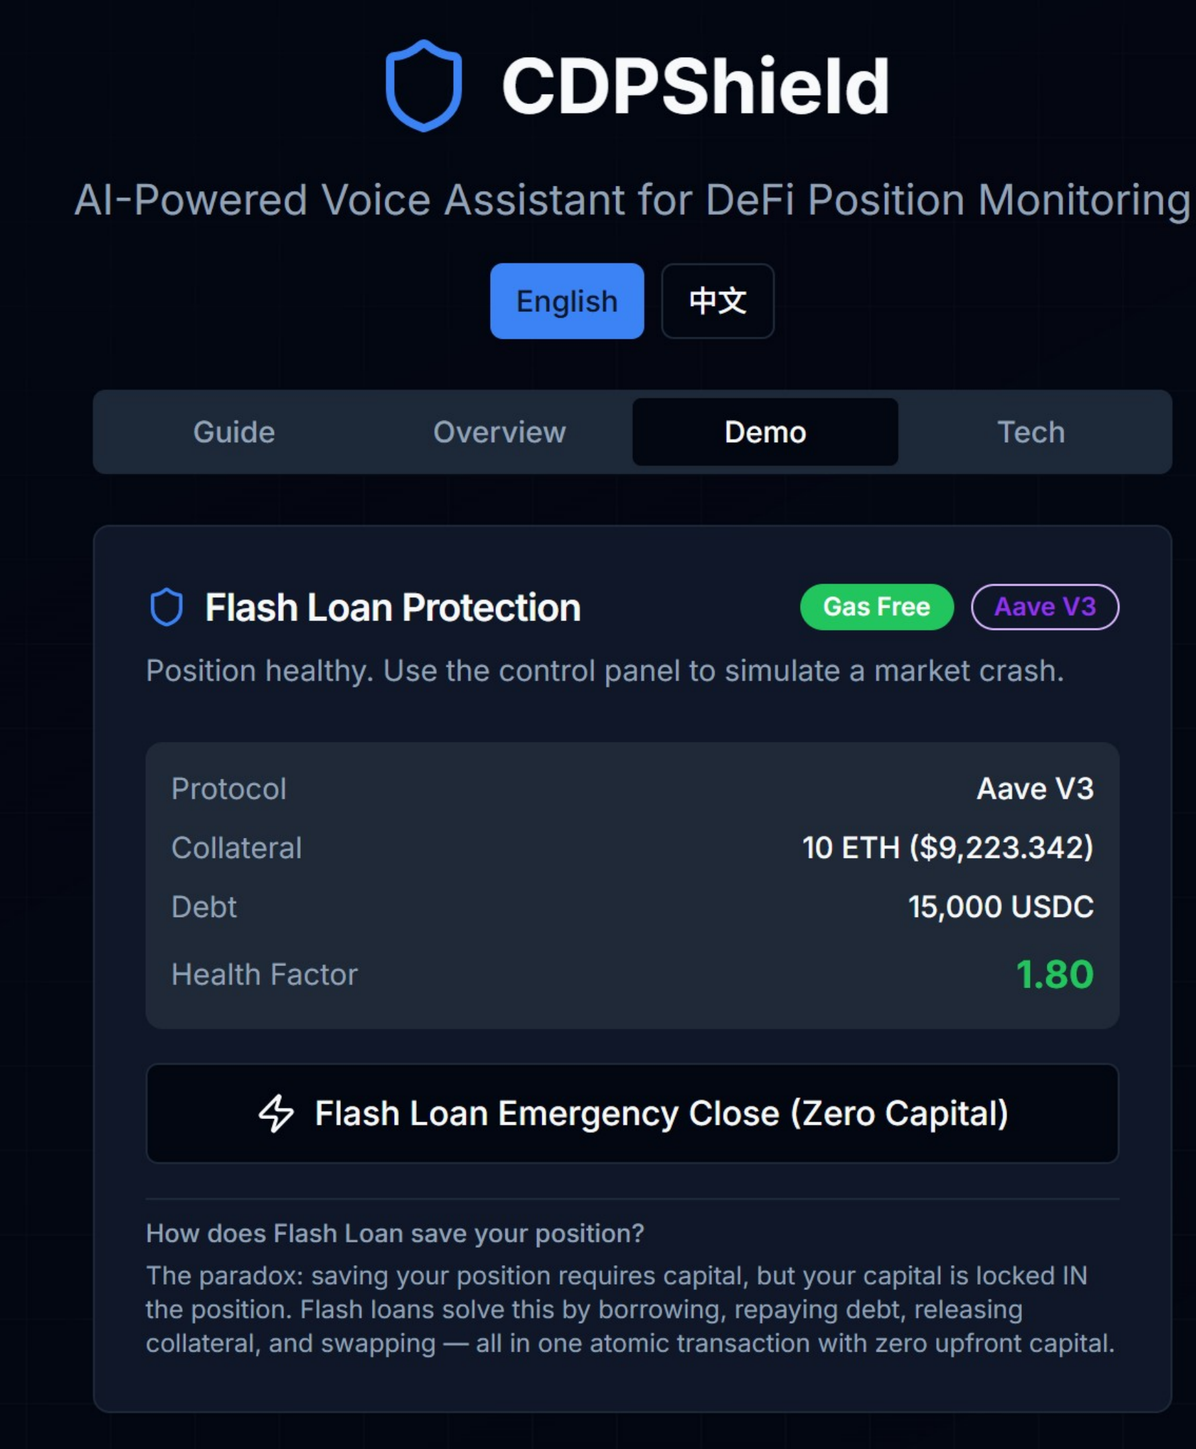

Continuous tracking ensures timely liquidation alerts.

Flash Loan Protection

Safeguard assets with atomic transaction security.

Product Dashboard

The **dashboard UI** of CDP Shield presents real-time data on collateral, borrowed amounts, and health factors. This intuitive interface helps users monitor their positions effectively, ensuring proactive management of their assets.

Flash Loan Position Close

Borrow

Borrow the debt asset through a flash loan. The funds are available only within this transaction and must be repaid before it completes.

Repay & Release

Use the flash-loaned funds to repay the position's debt, then withdraw the collateral released under the lending protocol's rules.

Swap

Swap enough of the withdrawn collateral into the debt asset to cover the flash-loan principal and fee, subject to the configured slippage limit.

Repay Flash Loan

Repay the flash-loan principal and fee, then return any remaining assets to the user. If repayment cannot complete, the transaction reverts.

Conceptual full-close flow. Fees, slippage and gas costs apply; atomic execution does not guarantee loss-free outcomes.

System Architecture Overview

The **CDP Shield** utilizes smart contracts deployed on BASE Sepolia, supported by a frontend stack leveraging Next.js and Coinbase Smart Wallet, ensuring low gas fees and efficient user experience.

Thank You

Protect Your Position, Protect Your Future
